## Ingersoll-Rand

CAMERON PUMP DIVISION

11 Broadway

New York, N. Y.

# Adequate Facilities Assure Superior Quality

Part of the Motorpump assembly line.

Photo-micrograph equipment in I-R metallurgical laboratory.

I-R pump testing laboratory.

## Manufacturing Plant

The Cameron plant of Ingersoll-Rand is devoted exclusively to the manufacture of pumps. It is thoroughly modern in both buildings and equipment

Motorpumps are manufactured in a separate section of this plant. In this section are many special purpose machine tools designed for a specific operation on Motorpump parts.

The modern equipment and the experienced personnel of this plant make possible the accurate workmanship and dependable service for which Motorpumps are known.

## Metallurgical Laboratory

Ingersoll-Rand has an outstanding Metallurgical laboratory. It includes a completely equipped chemical laboratory, physical test laboratory, pilot heat treating plant, and photo-micrograph and magnaflux equipment.

All materials used in Motorpumps are selected and tested in this laboratory. Ingersoll-Rand engineers have had wide experience in selecting materials for pumps in normal service and for pumps handling corrosive or erosive liquids.

## Hydraulic Laboratory

The facilities of the Ingersoll-Rand pump testing laboratory are unexcelled by those of any other pump manufacturer.

Equipment is available for producing and accurately measuring from  $\frac{1}{4}$  to 2700 hp. at speeds from 100 to 6500 rpm.

# Money Saving **MOTORPUMP** Characteristics

## Compact design

The 1/2-hp. Motorpump takes up less room than this booklet lying open on your desk. Other sizes are proportionately small. This compactness is possible because the Cameron pump and the General Electric motor are built together as one unit on a single shaft.

## Operation in any position

Motorpumps operate equally well in any position. No special foundation is required and the units may be bolted to the floor, wall, tank, column, or ceiling, as is most convenient.

## Low cost

The compact unit assembly simplifies the construction, lowers the weight, and reduces the purchase price.

## High efficiency

Motorpumps are designed to operate at standard motor speeds. The suction entrance is on the end and water enters directly into the eye of the impeller. This gives minimum obstruction and insures high efficiency.

## Rugged construction

The compact design of the Motorpump makes it unusually rigid and strong. This strength assures ability to stand up under severe service.

## Prompt shipment

Large factory and branch warehouse stocks insure prompt shipment. Stock shipment can be made of units for all usual conditions.

# MOTORPUMP

An Ingersoll-Rand Product

## Heavy-Duty Type Classes RV and MRV

Six, single-stage Motorpumps at a bulk oil terminal.

### Single-stage Units - Class RV

Class RV Heavy-Duty type Motorpumps are single-stage units with built-in electric motor. They are available in 1½, 2, 3, 4 and 5-inch discharge sizes with motors from 1 to 40 hp. They will handle from 10 to 1400 gals. per min. against heads to 240 ft.

Class RV, single-stage, heavy-duty Motorpump.

They are quality pumps in every respect. The shaft is of much larger diameter than is used in a standard motor. This insures a smooth running pump and minimum stuffing box care.

The bearing on the pump end of the unit is of the duplex, angular-contact type. It has several times the radial and thrust capacity of the bearing furnished on a standard motor.

The impeller is balanced both mechanically and hydraulically. A convenient impeller puller makes disassembly easy.

The shaft is fully protected within the pump and through the stuffing box by the impeller and shaft sleeves. The shaft sleeve is packed to prevent leakage underneath the sleeve.

An adjustable needle valve provides proper stuffing box seal and lubrication.

Suction and discharge connections are standard flange type.

### Two-Stage Units - Class MRV

Class MRV, two-stage, heavy-duty Motorpump.

Class MRV Motorpumps are two-stage units available in 1½ and 2-inch discharge sizes with motors from 10 to 50 hp. They will handle from 20 to 275 gals. per min. against heads to 500 ft.

They are of the same heavy duty construction and have the same refinements as the single-stage units described above. The two impellers are of the single-suction type mounted back to back.

Suction and discharge connections are of standard flange type.

# Features of Heavy-duty Motorpumps

**IMPELLER**

The impeller is of the latest hydraulic design. Mechanically and hydraulically balanced. An impeller puller makes disassembly easy.

**STUFFING BOX**

The stuffing box is unusually deep. An adjustable valve controls sealing water. Split gland is used. Ample space is provided to facilitate re-packing.

**SHAFT**

The shaft is oversize. Smooth running shaft reduces packing troubles. The shaft is fully protected against wear and corrosion.

**BEARINGS**

Bearings are oversize to carry combined pump and motor loads. Bearing cartridge excludes dust and moisture.

**MOTOR ROTOR**

The rotor is in perfect balance. Rotor laminations on polyphase motors are held in special aluminum alloy castings, eliminating the use of bolts, rivets and welding.

These features apply to all sizes from 1 1/2" to 5"

**SUCTION NOZZLE**

Nozzle leads directly into eye of the impeller thereby reducing suction losses. Removal of the nozzle gives complete access to the impeller and to the interior of the casing.

**PUMP CASING**

Flanged openings facilitate pipe connections. Renewable casing rings assure full capacity, pressure, and efficiency during the life of the pump.

**CONNECTING PIECE**

Extra heavy, barrel-type construction insures rigidity. Counter-bored joints insure permanent alignment. Supporting legs carry the weight of the pump.

**MOTOR END SHIELD**

A diaphragm completely separates the pump from the motor. A liquid flinger further protects bearings and motor windings from contamination.

**MOTOR STATOR**

All windings are immersed in "Glyptol" which is acid, moisture and oil resisting and which binds wires into a solid mass. The stator is standard and any electrical shop can service it.

# MOTORPUMP

An Ingersoll-Rand Product

## Standard Type Classes RVN and MRVN

Single-stage Class RVN Motorpump which circulates cooling water for a Diesel engine.

Class RVN standard Motorpump with fractional hp. motor.

Class RVN standard Motorpump with integral hp. motor.

### Single-Stage Units Class RVN

Class RVN Motorpumps are single-stage units with built-in electric motor. They are available in 1, 1½ and 2-inch discharge sizes with motors from ¼ to 5 hp. They will handle from 5 to 250 gals. per min. against heads to 140 ft.

The shaft is larger than that in a standard motor. The pump end bearing is of the deep-groove, angular-contact type and is 2 sizes larger than that in a standard motor.

Suction and discharge connections are threaded to receive standard pipe.

### Two-Stage Units Class MRVN

Class MRVN Motorpumps are two-stage units available in 1-inch discharge size with motors from 1½ to 5 hp. They will handle from 20 to 55 gals. per min. against heads to 200 ft.

#### Impeller

The one-piece impeller is of latest hydraulic design and is mechanically balanced.

#### Casing

The casing contains the suction and discharge nozzles. Discharge nozzle may be turned to four positions.

#### Stuffing Box

The stuffing box is extra deep, holding 5 rings of packing and a sealing gland.

#### Glands

The stuffing box glands are of the split type which are easily removed from the shaft.

#### Connecting Piece

The connecting piece has counterbored joints which assure a rigid assembly.

#### Bearings

The bearings are of the angular contact type with ample radial and thrust capacity.

#### Shaft

The shaft is much heavier than that in a standard motor insuring freedom from vibration.

#### Rotor

The motor rotor is of standard construction and is perfectly balanced.

#### Stator

The stator is of standard construction and can be serviced in any electrical shop.

# Open Impeller Motorpumps

Open impeller motorpumps may be equipped with the handhole type suction nozzle shown. Without this nozzle they look like the pumps on page 4.

For pumping paper stock, lime, sludge, sugar liquor, sewage, etc., which contain a certain amount of foreign material it is often necessary to use an open impeller pump. Motorpumps (also TRV and CRV units described on following pages) are available in many sizes with open impellers.

In external appearance they are exactly the same as the pumps described and illustrated on the preceding page. They may also be equipped with handhole type suction nozzle as illustrated at the left.

Two-vane open impeller.

Four-vane open impeller.

Open-impeller Motorpumps have a specially designed casing, impeller, and suction piece. The impellers have exceptionally large eyes, and the entrances have been carefully designed to prevent clogging. All passages are made amply large.

## Motorpump Modifications

Brewery fittings including companion flanges, valve and gauge.

Merco-Nordstrum grease seal for pumps handling gasoline and other similar liquids.

Smothering type glands for handling volatile liquids, etc.

Sling yoke mounting for Motorpumps in mine shaft drainage service.

Drip-lip base plate which can be furnished for Motorpumps.

Self priming Motorpump for mine drainage. Bulletin 2070-A.

Portable Motorpump for use in breweries, wineries, distilleries, dairies and other industries where a portable pump is convenient.

# Operates In Any Position

The MOTORPUMP operates perfectly in any position. Hundreds of units are operating vertically, at various angles, on the side and upside down.

This performance is made possible by the sturdy ball bearings and the rigid construction of the unit. They need no special foundation and may be bolted to floor, wall or ceiling as is most convenient.

Two Motorpumps slung from chains for emergency pumping service.

Motorpump mounted on its side on an air conditioning unit.

Two Motorpumps mounted vertically on the wall in a refinery.

Poly-phase A. C. motor.

Single-phase A. C. motor.

Explosion-proof motor.

Splash-proof motor.

Direct-current motor.

## All Types of Motors

Each MOTORPUMP has a General Electric motor built into it as an integral part of the unit. They are available in all types for all usual current conditions, including 50 and 60 cycle, single and poly-phase alternating current and direct current. Open, splash-proof, totally enclosed fan cooled, explosion proof and marine type motors are furnished. More than 3000 types and enclosures are available.

The motors are of the ball bearing type and the bearings are of very liberal capacity. They are grease lubricated and the grease needs to be replenished only at long intervals.

## Approximate Dimensions

**All dimensions given in inches.**  
**Based on use of open type A. C. motors. Dimensions and shipping**  
**weights will vary slightly when other motors are used. Do not use**  
**these dimensions for building foundations.**  
**Obtain certificate foundation print.**

[illegible]

Based on clear cold water with 15 ft. suction lift except those marked "a" which are based on 10 ft. lift. Selections in italics (such as *1RVN4*) are standard line Motorpumps. Selections in regular type (such as *1½RVH1*) are heavy-duty line Motorpumps. Selections with letter "M" in the symbol (such as *1MRVN2* and *1½MRV10*) are 2-stage Motorpumps.

# Motorpump Install

Motorpump handling mine water. This unit has a sling yoke mounting so that it may also be used for shaft dewatering.

Motorpump serving humidifying unit for conditioning a proof box in a bakery.

Motorpumps handling cooling water for two Ingersoll-Rand Diesel engines in a textile mill.

Two Motorpumps handling gasoline at a bulk distributing station.

# ations Everywhere

Motorpumps handling cooling water for compressors in a gas distribution station.

Two Motorpumps handling re-flux liquid in a refinery.

Four Motorpumps handling gasoline and oil in a bulk distributing station.

48840

Three open impeller motor pumps handling 4% stock in a paper mill.

# Close-Coupled Turbine-Driven Pumps

## Classes TRV and TMRV

Single-stage, Class TRV unit installed in a refinery.

Single-stage, Class TRV, pump.

Two-stage, Class TMRV, pump.

These units are complete, self-contained, turbine-driven pumping units having the pump impeller and turbine wheel mounted on a common shaft.

The same pump casings and fittings are used as for the Motorpumps described on the preceding pages. They are available in practically all of the heavy-duty sizes described on page 4.

For single-stage units (Classes TRV and TRVNL) capacities range from 5 to 1400 gals. per min. against heads to 240 ft. For two-stage units (Classes TMRV and TMRVN) capacities range from 20 to 275 gals. per min. against heads to 550 ft.

The steam turbine is of a type particularly suited for pump drive. Separate valves control the steam inlet nozzles, thus allowing exact control of the power output of the turbine. The governor is of the constant speed, centrifugal flyweight type designed for exacting service and close regulation.

### Governor

The governor is of slow-speed flyball type for exacting service. It is lubricated by sight feed oilers supplemented by an effective splash system.

### Turbine

The turbine is particularly suited for pump service and turbine wheel is of two-row velocity-stage type.

### Shaft

The shaft is extra-heavy and is completely covered within the pump by the impeller and shaft sleeve.

### Bearings

The bearings are of deep-groove, oil-lubricated type and are mounted in dust-tight housings.

### Glands

Stuffing box glands are of the split type, and are easily removed from the shaft.

### Stuffing Box

The stuffing box is extra deep and contains 5 or more rings of packing and a sealing gland.

### Impeller

The impeller is of the latest hydraulic design and is carefully balanced.

### Casing

The casing is vertically split and has short, carefully designed water passages.

# Approximate TRV Dimensions

## TRVN and TMRVN Units

| Size      | Pump  |        | Turbine |      | B     | C     | D      | G      | H     | L      | M      | O      | P  | R     |
|-----------|-------|--------|---------|------|-------|-------|--------|--------|-------|--------|--------|--------|----|-------|

Discharge nozzle may be turned to positions described at bottom of page 9.

Single-stage, class TRV, unit installed in an ice plant.

# Cradle-Mounted Pumping Units

## Heavy-Duty Type Classes CRV and CMRV

Single-stage unit handling wash water in a refinery.

### Single-stage units--Class CRV

Single-Stage, class CRV, with motor drive.

Class CRV cradle-mounted pumps are single-stage units which may be coupled to any type of driver. They are available in 1½, 2, 3, 4 and 5-inch discharge sizes. They will handle from 10 to 1400 gals. per min. against heads to 240 ft.

They are quality pumps in every respect. The same sturdy, high-efficiency pump casing is used as on the heavy-duty, class RV Motorpump.

The shaft is extra heavy insuring a smooth running pump and minimum stuffing box care.

The bearing on the pump end is of the two-row self aligning type and carries radial loads only. The bearing on the coupling end

is extra large. It is of the single-row, deep-groove type and carries both radial and thrust loads. The bearing housing is part of the cradle and is dust and moisture-tight.

The impeller is balanced both mechanically and hydraulically. A convenient impeller puller makes disassembly easy.

The shaft is fully protected within the pump and through the stuffing box by the impeller and shaft sleeve. The shaft sleeve is packed to prevent leakage under the sleeve. An adjustable needle valve provides proper stuffing box seal and lubrication.

The cradle is of heavy construction and rigidly supports the shaft and casing.

The suction is on the end of the pump and the discharge is part of the casing. The discharge is normally furnished vertical but may be turned at a 90° angle from the vertical. Suction and discharge connections are of standard flange construction.

The units are usually mounted on a baseplate with the driver. When standard N.E.M.A. frame motors are used the baseplate will be cast iron. For other drivers it is usually welded steel.

### Two-Stage Units--Class CMRV

Two-stage, Class CMRV, unit with turbine drive.

Class CMRV pumps are two-stage units available in 1½ and 2-inch discharge sizes. They will handle from 20 to 275 gals. per min. against heads to 500 ft.

They have the same quality features as the single-stage units described above. The two impellers are of the single-suction type mounted back to back.

Suction and discharge connections are of standard flange type.

# Features of Cradle-Mounted Units

## Wearing Rings

Stationary, renewable wearing rings seal impeller hubs against leakage.

## Suction Pipe

The suction pipe is easily removed and gives access to the impeller.

## Stuffing Box

The stuffing box is extra deep accommodating five or more rings of packing and a sealing gland.

## Impeller Puller

A slotted ring bearing on the shaft sleeve provides an easy means of removing the impeller.

## Thrust Bearing

The thrust bearing is extra large and of the single-row, deep-groove type. It carries both radial and thrust loads.

## Flexible Coupling

A flexible coupling of ample capacity absorbs end play in the driver shaft and compensates for temperature changes.

## Casing

The heavy casing contains the discharge nozzle, which may be turned to four positions.

## Glands

The glands are of the split type and may be easily removed from the shaft.

## Cradle

The cradle is extra heavy and rigidly supports the casing and shaft.

## Impeller

The impeller is of the latest hydraulic design. It is mechanically and hydraulically balanced.

## Inboard Bearing

The inboard bearing is of the double-row self-aligning type. It carries radial loads only.

## Shaft

The shaft is over-size thus insuring smooth operation and minimum deflection.

## Two-Stage Units

Two-stage units are of same general construction as single-stage units above. The two impellers are placed back to back. The thrust bearing is on the pump end and is of the duplex angular contact type. The pump suction is on the right looking toward the pump and the discharge on the left.

# Cradle-Mounted Pumping Units

## Standard Type Classes CRVN and CMRVN

CRVN unit installed in a manufacturing plant.

### Single-Stage Units--Class CRVN

Class CRVN pumps are single-stage units available in 1, 1½ and 2-inch discharge sizes. They will handle 5 to 250 gals. per min. against heads to 140 ft.

The units use the same high-quality casing and fittings as the standard type Motorpumps described on page 6.

Suction and discharge connections are threaded to receive standard pipe.

### Two-Stage Units--Class CMRVN

Class CMRVN pumps are two-stage units available in 1-inch discharge size. They will handle from 20 to 55 gals. per min. against heads to 200 ft. They have suction and discharge connections threaded to receive standard pipe.

Single-stage, class CRVN, unit with motor drive.

Two-stage, class CMRVN, unit with motor drive.

#### Casing

The casing contains suction and discharge nozzles. Discharge nozzle may be turned to 4 positions.

#### Impeller

The one-piece impeller is of latest hydraulic design and is mechanically balanced.

#### Suction Nozzle

The suction nozzle leads directly into the impeller eye.

#### Stuffing Box

The stuffing box is extra deep, holding 5 rings of packing and a sealing gland.

#### Inboard Bearing

The pump end bearing is of single-row, self-aligning type, carrying radial loads only.

#### Shaft

The shaft is extra-heavy insuring smooth running and minimum shaft deflection.

#### Thrust Bearing

The coupling end bearing is of the single-row, deep groove type and carries both thrust and radial loads.

#### Coupling

A coupling of ample size compensates for end play in the driver shaft and for temperature changes.

Cradle illustrated is used for units requiring up to 2 hp. On larger units the cradle is similar to that shown on page 17.

# Cradle-Mounted Pump Modifications and Types of Drive

Electric motor drive through increasing gear from 25-cycle motor.

Flat belt drive, less base. This style is widely used for irrigation work and other services where a base is unnecessary. Its flexibility of application and the fact that it can be shipped from stock on a day's notice are greatly increasing its uses.

Gasoline engine drive through gears.

These pumps are available for practically any type of drive. Motor and turbine drives are illustrated on pages 16 and 18 and some additional drives on this page. Most of the mechanical modifications shown on page 7 are also available on these pumps.

Water-cooled stuffing box and smothering type gland for use with volatile and high temperature liquids.

Water-wheel drive.

V-belt drive from motor.

# Approximate Dimensions of Cradle-Mounted Units

DO NOT USE THESE DIMENSIONS FOR BUILDING FOUNDATIONS. OBTAIN CERTIFIED FOUNDATION PRINT.

All dimensions in inches or feet and inches.

Two, single-stage, cradle-mounted units handling molasses in a sugar refinery.

Five, single-stage, cradle-mounted units handling cooling water in an oil field compressor plant.

Open-impeller, cradle-mounted unit handling stock in a paper mill

A single-pump condensate return unit mounted on a 15-gal. tank. This unit is used in connection with a steam heating system in a hotel.

Motorpump condensate return units consist of one or two standard, class RVN, Motopumps mounted on a tank and controlled by a float switch.

They are ideal for returning condensate to a boiler-feed pump, for feeding the boilers directly on low-pressure steam heating systems, for replacing steam traps or for returning condensate produced in process work.

A few standard sizes are listed below. Large capacity units, larger tanks or special mountings can be supplied to meet unusual conditions.

| Direct radiation sq. ft. | Max. disch. press. lbs. | Pumps used         | Size of reservoir gals. | Pump capacity gals. per min. | Pipe Sizes       |                | One Pump Unit       |                   | Two Pump Unit                      |                   |

Single-pump unit on 15 gal. tank.

Single-pump unit on 30-gal. tank.

Two-pump unit on 60 gal. tank.

# A Typical Pump Problem

An industrial plant wishes to install a pump to lift 200 gallons of water per min. at 72°F. from a sump to a tank on the roof. The water is to be delivered into the tank at 10 lbs. pressure. The tank is 58 feet above the pump and the pump is 4 ft. above the water level in the sump. The discharge pipe from the pump to the tank is 400 ft. long and contains 4 standard elbows, 1 check valve, and 1 gate valve. A 2½ inch discharge line is already installed which the manager would like to use if possible. The suction pipe is 4 inches in diameter, 25 ft. long and contains 2 elbows and a foot valve. The pump is to be driven by an electric motor. The current available is 220 volt, 3 phase 60 cycle. A sketch of the layout is shown below.

The friction loss and velocity head can be obtained from the tables on the next page. For comparison

two solutions are given: Solution A using 2½" discharge pipe and Solution B using 4 inch discharge pipe.

Solution A: shows 278.7' total head. From page 10 of this bulletin it is seen that a 2MRV25 pump would be required to handle 200 gals. per min. against this head.

Solution B: shows 108.6 ft. total head. From page 10 of this bulletin it is seen that a 2RV7½ pump will be required.

These two problems forcibly point out the savings that a discharge pipe of proper size make possible.

In solution A in which 2½" discharge pipe was used a 25 hp. pump is required. In solution B in which 4" discharge pipe is used only 7½ hp. is required to do the same job.

# Engineering Data

## Horsepower variation with specific gravity

To obtain power required for pumping a liquid of specific gravity differing from that of water, multiply power required when pumping water by specific gravity of liquid being pumped.

## Effect of viscosity

Viscous liquids tend to increase pump hp., reduce efficiency, head and capacity. Refer to nearest Ingersoll-Rand branch office for pump performance when liquid to be pumped has a viscosity over 60 S.S.U.

## Characteristics of liquids

| Liquid                      | Specific gravity at 60°F/60°F. | Viscosity S. S. U. |
|-----------------------------|--------------------------------|--------------------|
| Beer.....                   | 1.01                           | 32 at 68°F.        |
| Brine—calcium chloride..... | up to 1.3                      | 32 to 42 at 68°F.  |
| Brine—sodium chloride.....  | up to 1.2                      | 32 to 36 at 60°F.  |
| Fuel Oil—Nos. 1 and 2.....  | .825 to .95                    | 35 to 45 at 100°F. |
| Gasoline.....               | .721 to .731                   | 30 at 68°F.        |
| Kerosene.....               | .81                            | 35 at 68°F.        |
| Milk.....                   | 1.03 to 1.04                   | 32 at 68°F.        |
| Water, fresh.....           | 1.0                            | 31.5 at 60°F.      |

## Friction Losses through Screw Pipe Fittings in terms of equivalent lengths of standard pipe.

| Nominal Pipe Size, Inches | Actual Inside Diameter, Inches | Gate Valve | Long-Sweep Elbow or on Run of Standard Tee | Medium-Sweep Elbow or on Run of Tee Reduced in Size ¼ | Standard Elbow or on Run of Tee Reduced in Size ½ | Angle Valve | Close Return Bend | Tee Through Side Outlet | Globe Valve | Check Valve (Approx.) varies with type & make |
|---------------------------|--------------------------------|------------|--|---|---|-------------|-------------------|-------------------------|-------------|---|

Foot valve loss is zero, provided foot valve has area of 150.. of suction pipe.

## Pipe Friction and Velocity Head

Corresponding to "17 year pipe". For new and smooth iron pipe the head loss will be .7 of that shown.

# Other I-R Products

## Aftercoolers, Air and Gas

## Air- and Gas-Lift Pumps

## Blowers, Air and Gas

- Exhausters
- Motorblowers*
- Turbo-Blowers
- Turbo-Compressors

## Core Drills

- Calyx*
- Coroc*
- Explorer*
- Diamond
- Manhole
- Pavement-Testing
- Prospecting
- Shaft-Work

## Compressors

- Air and Gas
- Air- and Water-Cooled
- Ammonia
- Combined Engine-Compressor Units for Steam, Gas and Oil Drive
- Direct-Connected Electric and Belted
- High- and Low-Pressure
- Mine-Car
- Motorcompressors*
- Portable
- Service-Station
- Single- and Multi-Stage
- Vacuum Pumps

## Condensers

- Counter-Current
- Barometric, *Disc-Flow*
- Ejector-Jet Barometric
- Surface, *Heart-Shape*

## Drill Steel and Jackrods

## Engines

- Stationary Diesel
- Stationary Gas
- Marine Diesel

## Hoists

- Air- and Electric-Driven
- Air-Motor (Direct-Lift)
- Gasoline- and Oil-Engine Driven
- Scraper
- Single-, Double- and Three-Drum
- Slusher
- Tugger*
- Utility*

## Jackbits

- Jackbit Grinders
- Jackbits* (Detachable Bits)
- Jackmills*
- Jackrods* (Drill rods threaded for Jackbits)
- Jackrod Threading Equip't

## Paving Breakers

- Demolition Tools

## Pile Drivers

## Pneumatic Tools

- Accessories and Hose
- Backfill Tampers
- Chippers
- Calking Hammers
- Concrete Vibrators
- Core Breakers
- Diggers
- Drills, *Multi-Vane* and Piston
- Fender Straightener
- Grinders, *Multi-Vane* and Piston
- Impact Wrenches*
- Riveters and Holders-On
- Sanders
- Sand Rammers
- Saws, *Safety First*
- Scaling Hammers
- Screw Drivers and Nut Setters
- Stationary Motors
- Surfacers
- Wire Brushes
- Wood Borers
- Wrenches, Torque and Impact

## Pneumatic Sump Pumps

## Pumps (Cameron)

- Boiler-Feed
- Brewery
- Cam-Pump* (Rotary)
- Centrifugal
- Chemical
- Circulating
- Condensate-Return
- General-Service
- High-Pressure
- Hot-Oil
- Mine
- Motorpumps*
- Paper-Stock
- Pipe-Line
- Reciprocating
- Refinery
- Sinker

## Receivers, Air and Gas

## Refrigerating Units

- Ammonia Compressors
- Steam-Jet Water-Vapor

## Rock Drills

- Accessories and Hose
- Auto-Feed*
- Drifters
- Jackbits*
- Jackhammers*
- Mountings
- Pickhammers*
- Power-Feed*
- Stopehammers*
- Submarine
- Wagon-Mounted
